TABLE OF CONTENTS

SUMMARY

The Casella Subdivision proposal is a 3-lot subdivision of an 11.7-acre parcel located southeasterly of the Knollwood Drive cul-de-sac. The subdivision contains two rear lots and 1 frontage lot. All lots will be accessed by a common driveway from Knollwood Drive. Additionally, a previously approved rear lot (owned by the applicant but not a part of this application) will also be accessed by the common drive.

Topography of the site is moderately steep with approximately 41,200 s.f. (0.95 acres) of the site with slopes over 20%. The steep slope areas are scattered throughout the site. The site also contains some ledge outcrops and many large boulders. Sols on the site are predominantly Charlton and Hollis series (hydrologic soil groups B & D). Vegetation on the site consists of a mixed hardwood forest with scattered pines. Surface water runoff generally flows from the northeast to the southwest. A wetland area exists which was delineated by Cynthia Rabinowitz and field surveyed by Dutton Associates.

Storm water runoff generally flows from the northeast to the southwest and ultimately to a wetland area east, southeast of the site, then water flows southerly through the wetland area to Hebron Avenue, and easterly along the northerly gutter of Hebron Avenue to a catch basin inlet by building #2390, thence southerly through a pipe system to a discharge locates at a wetland area just easterly of Sturgeon River Road.

A subsurface drainage system has been designed to collect runoff from the common driveway. The flows are directed to a detention pond located at the southwesterly corner of the site. The storm drain system was designed for the 10-year storm using the rational method. The gutter flow analysis, pipe design, and headwater analysis were conducted per the Connecticut DOT Drainage manual.

Proposed storm flows from the site are directed to a detention pond located along the southerly end of the site. Hydrology computations were conducted using the TR-55 Method with routing computations run using the Hydraflow Hydrographs program. The detention pond was sized to mitigate for any increase in flow for the 2-year through the 100-year storms.

The detention pond will also be used to treat the water quality volume (WQV) from the site. The detention pond has been designed to contain the entire water quality volume below the first outlet flow structure. The WQV will be collected using an underdrain system located at the bottom of the detention pond with the outflow from the underdrain regulated by an orifice sized to drain the WQV over a 40-hour period.

Below is a summary of the pre and post development flows from the site.

STORM	EXIST. "A"	EXIST. "B"	PROP. "A"	PROP. "B"
2-YEAR	1.4 CFS	1.7 CFS	1.3 CFS	1.5 CFS
10-YEAR	4.1 CFS	6.8 CFS	3.7 CFS	6.1 CFS
25-YEAR	6.1 CFS	10.8 CFS	5.5 CFS	10.2 CFS
50-YEAR	7.5 CFS	14.0 CFS	6.9 CFS	13.5 CFS
100-YEAR	9.2 CFS	17.8 CFS	8.4 CFS	17.4 CFS

CONCULSION

Based on the analysis conducted, the proposed Casella Development will not have an adverse impact on downstream properties.

Table 2-2a.—Runoff curve numbers for urban areas[1]

Cover description		Curve numbers for hydrologic soil group—			
Cover type and hydrologic condition	Average percent impervious area[2]	A	B	C	D
Fully developed urban areas (vegetation established)					
Open space (lawns, parks, golf courses, cemeteries, etc.)[3]:					
Poor condition (grass cover < 50%)		68	79	86	89
Fair condition (grass cover 50% to 75%)		49	69	79	84
Good condition (grass cover > 75%)		39	61	74	80
Impervious areas:					
Paved parking lots, roofs, driveways, etc. (excluding right-of-way)		98	98	98	98
Streets and roads:					
Paved; curbs and storm sewers (excluding right-of-way)		98	98	98	98
Paved; open ditches (including right-of-way)		83	89	92	93
Gravel (including right-of-way)		76	85	89	91
Dirt (including right-of-way)		72	82	87	89
Western desert urban areas:					
Natural desert landscaping (pervious areas only)[4]		63	77	85	88
Artificial desert landscaping (impervious weed barrier, desert shrub with 1- to 2-inch sand or gravel mulch and basin borders)		96	96	96	96
Urban districts:					
Commercial and business	85	89	92	94	95
Industrial	72	81	88	91	93
Residential districts by average lot size:					
1/8 acre or less (town houses)	65	77	85	90	92
1/4 acre	38	61	75	83	87
1/3 acre	30	57	72	81	86
1/2 acre	25	54	70	80	85
1 acre	20	51	68	79	84
2 acres	12	46	65	77	82
Developing urban areas					
Newly graded areas (pervious areas only, no vegetation)[5]		77	86	91	94
Idle lands (CN's are determined using cover types similar to those in table 2-2c).					

[1]Average runoff condition, and $I_a = 0.2S$.
[2]The average percent impervious area shown was used to develop the composite CN's. Other assumptions are as follows: impervious areas are directly connected to the drainage system, impervious areas have a CN of 98, and pervious areas are considered equivalent to open space in good hydrologic condition. CN's for other combinations of conditions may be computed using figure 2-3 or 2-4.
[3]CN's shown are equivalent to those of pasture. Composite CN's may be computed for other combinations of open space cover type.
[4]Composite CN's for natural desert landscaping should be computed using figures 2-3 or 2-4 based on the impervious area percentage (CN = 98) and the pervious area CN. The pervious area CN's are assumed equivalent to desert shrub in poor hydrologic condition.
[5]Composite CN's to use for the design of temporary measures during grading and construction should be computed using figure 2-3 or 2-4, based on the degree of development (impervious area percentage) and the CN's for the newly graded pervious areas.

Table 2-2c.—Runoff curve numbers for other agricultural lands[1]

Cover description		Curve numbers for hydrologic soil group—			
Cover type	Hydrologic condition	A	B	C	D
Pasture, grassland, or range—continuous forage for grazing.[2]	Poor	68	79	86	89
	Fair	49	69	79	84
	Good	39	61	74	80
Meadow—continuous grass, protected from grazing and generally mowed for hay.	—	30	58	71	78
Brush—brush-weed-grass mixture with brush the major element.[3]	Poor	48	67	77	83
	Fair	35	56	70	77
	Good	[4]30	48	65	73
Woods—grass combination (orchard or tree farm).[5]	Poor	57	73	82	86
	Fair	43	65	76	82
	Good	32	58	72	79
Woods.[6]	Poor	45	66	77	83
	Fair	36	60	73	79
	Good	[4]30	55	70	77
Farmsteads—buildings, lanes, driveways, and surrounding lots.	—	59	74	82	86

[1]Average runoff condition, and $I_a = 0.2S$.

[2]*Poor:* <50% ground cover or heavily grazed with no mulch.
Fair: 50 to 75% ground cover and not heavily grazed.
Good: >75% ground cover and lightly or only occasionally grazed.

[3]*Poor:* <50% ground cover.
Fair: 50 to 75% ground cover.
Good: >75% ground cover.

[4]Actual curve number is less than 30; use CN = 30 for runoff computations.

[5]CN's shown were computed for areas with 50% woods and 50% grass (pasture) cover. Other combinations of conditions may be computed from the CN's for woods and pasture.

[6]*Poor:* Forest litter, small trees, and brush are destroyed by heavy grazing or regular burning.
Fair: Woods are grazed but not burned, and some forest litter covers the soil.
Good: Woods are protected from grazing, and litter and brush adequately cover the soil.

Pond Data

Contours - User-defined contour areas. Conic method used for volume calculation. Begining Elevation = 520.00 ft

Stage / Storage Table

Stage (ft)	Elevation (ft)	Contour area (sqft)	Incr. Storage (cuft)	Total storage (cuft)
0.00	520.00	2,862	0	0
1.00	521.00	3,514	3,182	3,182
2.00	522.00	4,223	3,863	7,045
3.00	523.00	4,988	4,600	11,645
4.00	524.00	5,810	5,393	17,038
5.00	525.00	6,689	6,244	23,281
6.00	526.00	7,623	7,150	30,432

Culvert / Orifice Structures

	[A]	[B]	[C]	[PrfRsr]
Rise (in)	= 15.00	5.25	0.81	0.00
Span (in)	= 15.00	5.25	0.81	0.00
No. Barrels	= 1	1	1	0
Invert El. (ft)	= 518.20	520.70	519.50	0.00
Length (ft)	= 55.40	0.50	0.00	0.00
Slope (%)	= 3.07	0.00	0.00	n/a
N-Value	= .012	.015	.013	n/a
Orifice Coeff.	= 0.60	0.80	0.61	0.60
Multi-Stage	= n/a	Yes	Yes	No

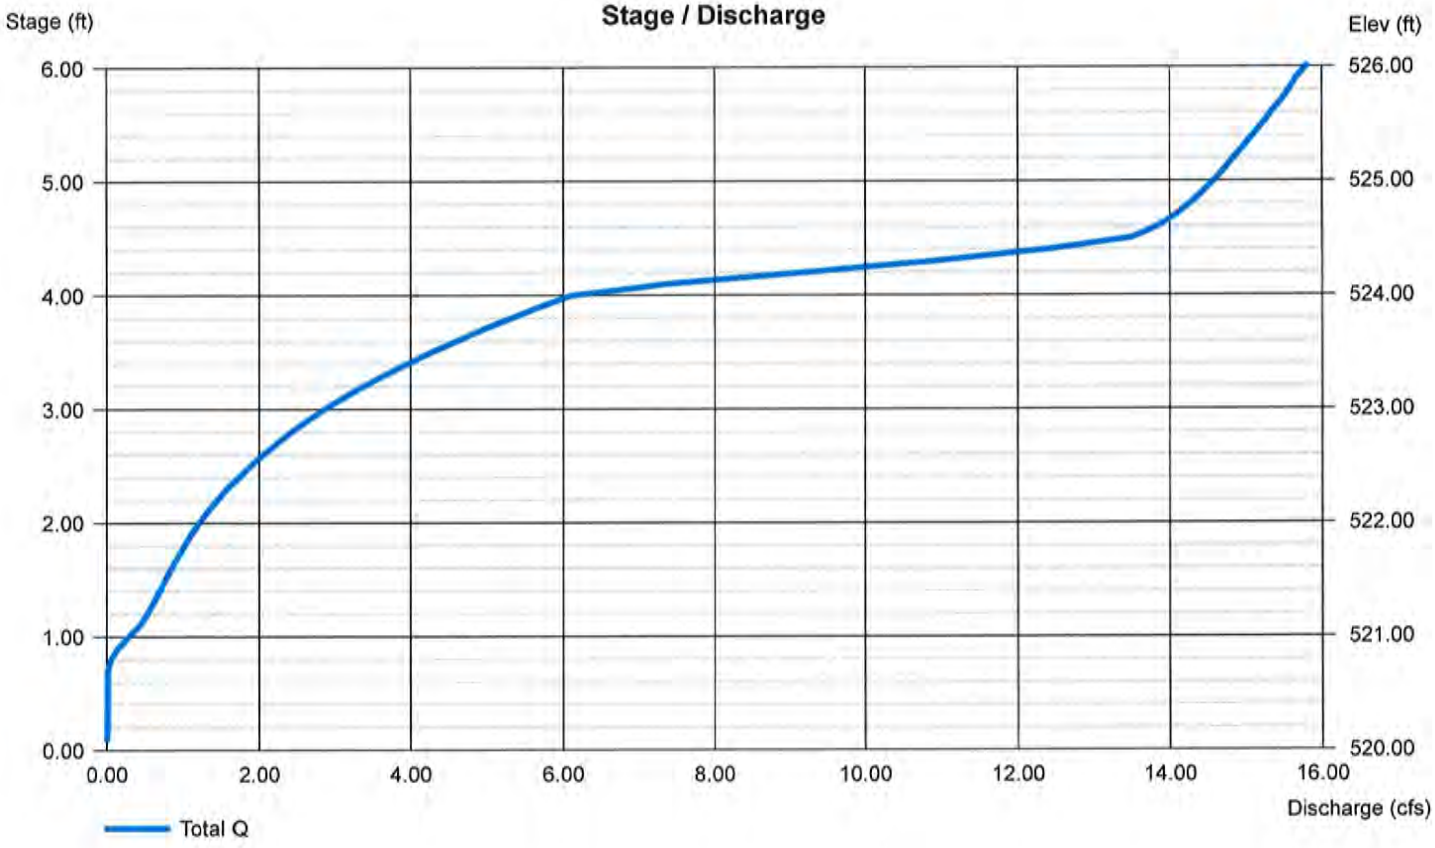
Weir Structures

	[A]	[B]	[C]	[D]
Crest Len (ft)	= 0.00	8.00	Inactive	Inactive
Crest El. (ft)	= 521.20	524.00	0.00	0.00
Weir Coeff.	= 0.33	3.33	3.33	3.33
Weir Type	= 15 degV	Rect	---	---
Multi-Stage	= Yes	Yes	No	No

Exfil.(in/hr) = 0.000 (by Wet area)

TW Elev. (ft) = 0.00

Note: Culvert/Orifice outflows are analyzed under inlet (ic) and outlet (oc) control. Weir risers checked for orifice conditions (ic) and submergence (s).



Submerged Orifices

Flow through a submerged orifice may be computed by applying Bernoulli's equation to points 1 and 2 in figure below

$$V_2 = \sqrt{2g\left(h_1 - h_2 + \frac{V_1^2}{2g} - h_L\right)}$$

where h_L = losses in head, ft (m), between 1 and 2.

By assuming $V_1 \approx 0$, setting $h_1 - h_2 = \Delta h$, and using a coefficient of discharge C to account for losses, the following formula is obtained:

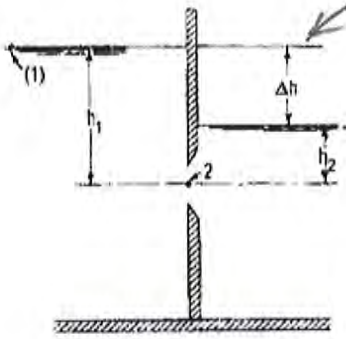
$$Q = Ca\sqrt{2g\,\Delta h}$$

C = ORIFICE COEFFICIENT (0.61) FOR SHARP EDGE ORIFICE

g = 32.2 FT/SEC²

a = ORIFICE AREA

h = HEAD



EL OF WQV (520.7)

VOL = 2161 FT³

BOTTOM OF DETENTION POND EL 520

ΔH = 0.7'

Values of C for submerged orifices do not differ greatly from those for nonsubmerged orifices.

ORIFICE SIZING

AVG Q REQUIRED FOR 40 HR, 2161 FT³ =

$\frac{2161}{144{,}000} = 0.0150$ CFS

$0.0150 = 0.6 \times a \sqrt{64.4 \times 0.7}$

$0.0150 = 4.09569$

$a = 0.00366\ FT^2 = 0.5274\ IN^2$ $\phi \approx 13/16$

3. DISCHARGE COEFFICIENT VALUES

3.1 Relationship to Resistance coefficient K

The discharge coefficient may be directly related to the resistance coefficient via the follow equation:

$$K = \frac{1}{C_d^2}$$

3.2 Typical Values for Discharge Coefficient C_d

For simple pressure loss or flow rate calculations where high accuracy is not critical the following typical values may be used:

Equipment Type	β min	β max	C_d
Orifice Plate, thin sharp edged	-	-	0.61
Venturi Nozzle, Machined	0.4	0.75	0.995
Venturi Nozzle, Rough Welded Sheet Metal	0.4	0.70	0.985
Venturi Nozzle, Rough Cast	0.3	0.77	0.984

3.3 Precise Relationships for Discharge Coefficient

Where a higher degree of accuracy is required, such as for flow rate measurement, the relationships below may be used.

$$C_d = C_\infty + \frac{b}{Re^n}$$

Values for C_∞, b and n are presented below. Dimensions in millimeters.

Device	$C_{d,\infty}$
Venturi Nozzle, Machined Inlet	0.995
Venturi Nozzle, Cast Inlet	0.984
	0.985

Inputs	
Channel Discharge (Q):	5.5 cfs
Peak Flow Period (H):	12 hours
Channel Slope (S0):	0.14 ft/ft
Bottom Width (B):	6 ft
Left Side Slope (ZL):	2 (H : V)
Right Side Slope (ZR):	2 (H : V)
Existing Channel Bend:	Yes
Bend Coefficient (Kb):	
Channel Bend Radius:	53 ft
Retardance Class of Vegetation:	C 6-12 in
Vegetation Type:	None
Vegetation Density:	None
Soil Type:	Fine Sand (ML)
Channel Lining Options	
Rock Riprap Protection Type	Permanent

Basic Relationships
A = Cross sectional area, ft2 (m2) = (B * D) + (Z_L / 2 * D2) + (Z_R / 2 * D2)
Where:
B = Base width of channel, ft (m)
D = Flow depth, ft (m)
Z_L = Left side bank slope (H : 1 V)
Z_R = Right side bank slope (H : 1 V)
P = Wetted perimeter, ft (m) = B + Z_L * D + Z_R * D
R = Hydraulic radius, ft (m) = A / P
V = Flow velocity, ft/s (m/s) = Q / A
Where:
Q = Channel discharge, cfs (cms)
Taua Average bed shear stress, psf (Pa) = 62.4 * R * S0
Where:
S0 = Gradient of channel, ft/ft (m/m)
Tau_0 = Maximum bed shear stress, psf (Pa) = 62.4 * D * S_0

Unvegetated Conditions Computations:
n = Manning's n = a * Tauab
and (iteratively solved)
$n = 1.486 / Q * A * R(2/3)S_0^{0.5}$
Where:
n = Manning's n
a = Product specific coefficient from performance testing
b = Product specific coefficient from performance testing
SF_P = Product factor of safety = Tau_T / Tau_0

Where:
TauT = Permissible shear stress from testing, psf (Pa)
Tau_P = In place permissible shear, psf (Pa) = Tau_T / alpha * (Tau_S + alpha / 4.3)
Where:
alpha = unit conversion constant, 0.14 English, 6.5 Metric
Tau_S = Permissible shear stress of soil
SFL = Factor of safety of installed liner = Taup / Taua

Vegetated Computations:
n = Manning's n = alpha * Cn* Taua-0.4
and (iteratively solved)
$n = 1.486 / Q * A * R(2/3)S_0^{0.5}$
Where:
alpha = Unit conversion constant, 0.213 English, 1.0 Metric
Cn = Vegetation retardance coefficient
SF_P = Product factor of safety = Tau_{RV} / Tau_0
Where:
Tau_{RV} = Permissible shear stress from testing, psf (Pa)
Tau_P = In place permissible shear, psf (Pa) = Tau_S / (1 – C_{TRM}) * (n / ns)2
Where:
C_{TRM} = Coefficient of TRM performance derived from testing Tau_S = Permissible shear stress of soil
ns = Manning's of soil bed if left unprotected
SF_L = Factor of safety of installed liner = Tau_P / Tau_a

Glastonbury, CT 06033

LOCATION: Casella property,
Knollwood Drive, Glastonbury,
Connecticut

SOILS AND WETLANDS REPORT

INSPECTION DATE:	4/7/10
MAP PROVIDED:	topographical
CONTOUR INTERVAL SHOWN	2 ft
SCALE SHOWN:	40
SOIL MOISTURE CONDITIONS:	moist
PROPERTY LINES IDENTIFIABLE:	not clear
WETLAND FLAG NUMBERING SEQUENCE:	#1 - #29

This site inspection was conducted to evaluate the presence of inland-wetlands and watercourses. A detailed classification of the soils was not part of this study. Field observations of the wetland and upland soils together with the classification system of the National Cooperative Soil Survey, USDA, and the County Soil Legend were used in this investigation to identify the soil series names.

In conducting field investigations, soil borings are taken from which many important soil properties are observed, as follows: seasonal soil moisture condition OR the presence of free water and its depth, for each horizon in the soil profile, the thickness, color and texture are also observed. The areas shown on soil maps are called soil map units. Some map units consist of one kind of soil while others consist of two or more kinds of soil. A few have little or no soil material at all. The information in this report is based on examination and interpretation of soils with the use of a hand auger and shovel. Wetland delineation is based on prevailing conditions at the time of investigation and best professional judgment. Field conditions may change over time.

COMMENTS: This parcel is situated south of the cul-de-sac of Knollwood Drive and comprises hilly, rocky land which slopes to the south and southwest. Shallow bedrock controls the topography and outcroppings are noted in the vicinity. Southwest of the parcel property line, on property of Mr. and Mrs. George Mikk, is a valley/swale area that receives drainage from the surrounding hillsides. A wetland was identified at the top of this valley and behind a house located on the west side of the cul-de-sac. The boundary of the wetland was delineated and continued along the watercourse which drains out of the wetland towards the south. At the bottom of the steep incline, the watercourse broadens out into a larger wetland. As requested, only the east side of the wetlands and watercourse were delineated since this drainage is not on the subject parcel of Mr. Casella.

P.O. Box 365 | Bethlehem, Connecticut 06751 | Tel: 203-266-5595 | Fax: 203-266-6227 | Email: connsoil@att.net

Soils formed in glacial till and descriptions are included below for convenience.

WETLAND SOILS

SOIL TYPE:	LEICESTER
DEPTH TO MOTTLING:	6"
DEPTH TO BEDROCK:	>60"
DEPTH TO SEASONAL HIGH WATER TABLE:	0-8"

A poorly drained soil on nearly level or gently sloping land, the Leicester series consist of soils that developed in friable to firm glacial till. These soils occupy wet, low-lying areas or concave side slope areas. The permeability of the soils is moderate in the surface layer and subsoil and is moderately rapid in the substratum.

SOIL TYPE:	WHITMAN
DEPTH TO MOTTLING:	18"
DEPTH TO BEDROCK:	>60"
DEPTH TO SEASONAL HIGH WATER TABLE:	0-6"

These very poorly drained soils occur in low-lying, small to medium sized areas where they receive runoff and, in places, material washed from surrounding soils. A typical profile has a surface layer of black stony, fine sandy loam or silt loam about 10 inches thick. Next is a strongly gleyed subsurface layer of gray to light gray loamy sand. The subsoil, which is gleyed, consists of gray and greenish-gray fine sandy loam that is distinctly mottled with various shades of brown.

NON-WETLAND SOILS

SOIL TYPE:	CHARLTON-HOLLIS
DEPTH TO MOTTLING:	NO MOTTLING
DEPTH TO BEDROCK:	CHARLTON - >60"; HOLLIS – 10-20"
DEPTH TO SEASONAL HIGH WATER TABLE:	>6'

This is a complex of well-drained soils found on gently sloping and sloping, uplands where the relief is affected by the underlying bedrock. Slopes may be either concave or convex. The areas frequently have a rough surface topography with bedrock outcrops and a few narrow intermittent drainageways and small wet depressions. Included with this complex in mapping, are small areas, generally less than 1 acre in size, of moderately well-drained Sutton soils, well-drained Paxton soils and poorly drained Leicester soils. In a few areas the stones and boulders have been cleared. Also included are many small and intermingled areas where the bedrock is 20-40 inches from the

surface. During construction, conservation measures are essential to prevent excessive runoff, erosion and siltation.

SOIL TYPE:	GLOUCESTER
DEPTH TO MOTTLING:	NONE
DEPTH TO BEDROCK:	>60"
DEPTH TO SEASNAL HIGH WATER TABLE:	>40"

A somewhat excessively drained soil that developed in very friable, coarse-textured glacial till derived mainly from coarse-textured granite but in places included some gneiss. The soil material has a relatively high sand content. Permeability is rapid.

Sincerely yours,

Cynthia M. Rabinowitz
Soil Scientist/Landscape Designer

State of Connecticut

73E—Charlton-Chatfield complex, 15 to 45 percent slopes, very rocky

Map Unit Setting

National map unit symbol: 9lql
Elevation: 0 to 1,200 feet
Mean annual precipitation: 43 to 56 inches
Mean annual air temperature: 45 to 55 degrees F
Frost-free period: 140 to 185 days
Farmland classification: Not prime farmland

Map Unit Composition

Charlton and similar soils: 45 percent
Chatfield and similar soils: 30 percent
Minor components: 25 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Charlton

Setting

Landform: Hills
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Coarse-loamy melt-out till derived from granite and/or schist and/or gneiss

Typical profile

Ap - 0 to 4 inches: fine sandy loam
Bw1 - 4 to 7 inches: fine sandy loam
Bw2 - 7 to 19 inches: fine sandy loam
Bw3 - 19 to 27 inches: gravelly fine sandy loam
C - 27 to 65 inches: gravelly fine sandy loam

Properties and qualities

Slope: 15 to 45 percent
Percent of area covered with surface fragments: 1.6 percent
Depth to restrictive feature: More than 80 inches
Natural drainage class: Well drained
Runoff class: High
Capacity of the most limiting layer to transmit water (Ksat): Moderately high to high (0.57 to 5.95 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water storage in profile: Low (about 5.9 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 7s

Hydrologic Soil Group: B
Hydric soil rating: No

Description of Chatfield

Setting

Landform: Ridges, hills
Down-slope shape: Convex
Across-slope shape: Linear
Parent material: Coarse-loamy melt-out till derived from granite and/or schist and/or gneiss

Typical profile

Oa - 0 to 1 inches: highly decomposed plant material
A - 1 to 6 inches: gravelly fine sandy loam
Bw1 - 6 to 15 inches: gravelly fine sandy loam
Bw2 - 15 to 29 inches: gravelly fine sandy loam
2R - 29 to 80 inches: unweathered bedrock

Properties and qualities

Slope: 15 to 45 percent
Percent of area covered with surface fragments: 1.6 percent
Depth to restrictive feature: 20 to 40 inches to lithic bedrock
Natural drainage class: Well drained
Runoff class: High
Capacity of the most limiting layer to transmit water (Ksat): Low to high (0.01 to 5.95 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water storage in profile: Low (about 3.3 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 7s
Hydrologic Soil Group: B

Hydric soil rating: No

Unnamed, red parent material

Percent of map unit: 1 percent
Hydric soil rating: No

Data Source Information

Soil Survey Area: State of Connecticut
Survey Area Data: Version 19, Sep 13, 2019

gf

State of Connecticut

73C—Charlton-Chatfield complex, 0 to 15 percent slopes, very rocky

Map Unit Setting

National map unit symbol: 2w698
Elevation: 0 to 1,550 feet
Mean annual precipitation: 36 to 71 inches
Mean annual air temperature: 39 to 55 degrees F
Frost-free period: 140 to 240 days
Farmland classification: Not prime farmland

Map Unit Composition

Charlton, very stony, and similar soils: 50 percent
Chatfield, very stony, and similar soils: 30 percent
Minor components: 20 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Charlton, Very Stony

Setting

Landform: Hills, ridges
Landform position (two-dimensional): Backslope, shoulder, summit
Landform position (three-dimensional): Crest, side slope, nose slope
Down-slope shape: Linear, convex
Across-slope shape: Convex
Parent material: Coarse-loamy melt-out till derived from granite, gneiss, and/or schist

Typical profile

Oe - 0 to 2 inches: moderately decomposed plant material
A - 2 to 4 inches: fine sandy loam
Bw - 4 to 27 inches: gravelly fine sandy loam
C - 27 to 65 inches: gravelly fine sandy loam

Properties and qualities

Slope: 3 to 15 percent
Percent of area covered with surface fragments: 1.6 percent
Depth to restrictive feature: More than 80 inches
Natural drainage class: Well drained
Runoff class: Low
Capacity of the most limiting layer to transmit water (Ksat): Moderately low to high (0.14 to 14.17 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Salinity, maximum in profile: Nonsaline (0.0 to 1.9 mmhos/cm)
Available water storage in profile: Moderate (about 8.7 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 6s
Hydrologic Soil Group: B
Hydric soil rating: No

Description of Chatfield, Very Stony

Setting

Landform: Hills, ridges
Landform position (two-dimensional): Backslope, summit, shoulder
Landform position (three-dimensional): Crest, side slope, nose slope
Down-slope shape: Convex
Across-slope shape: Linear, convex
Parent material: Coarse-loamy melt-out till derived from granite, gneiss, and/or schist

Typical profile

Oi - 0 to 1 inches: slightly decomposed plant material
A - 1 to 2 inches: fine sandy loam
Bw - 2 to 30 inches: gravelly fine sandy loam
2R - 30 to 40 inches: bedrock

Properties and qualities

Slope: 3 to 15 percent
Percent of area covered with surface fragments: 1.6 percent
Depth to restrictive feature: 20 to 41 inches to lithic bedrock
Natural drainage class: Well drained
Runoff class: High
Capacity of the most limiting layer to transmit water (Ksat): Very low (0.00 to 0.00 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Salinity, maximum in profile: Nonsaline (0.0 to 1.9 mmhos/cm)
Available water storage in profile: Low (about 4.3 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 6s
Hydrologic Soil Group: B
Hydric soil rating: No

Minor Components

Sutton, very stony

Percent of map unit: 5 percent
Landform: Hills, ground moraines
Landform position (two-dimensional): Footslope
Landform position (three-dimensional): Base slope
Down-slope shape: Concave
Across-slope shape: Linear

Hydric soil rating: No

Rock outcrop

Percent of map unit: 5 percent
Hydric soil rating: No

Hollis, very stony

Percent of map unit: 5 percent
Landform: Ridges, hills
Landform position (two-dimensional): Backslope, shoulder, summit
Landform position (three-dimensional): Crest, side slope, nose slope
Down-slope shape: Convex
Across-slope shape: Linear, convex
Hydric soil rating: No

Leicester, very stony

Percent of map unit: 5 percent
Landform: Drainageways, depressions
Down-slope shape: Linear
Across-slope shape: Concave
Hydric soil rating: Yes

[1] Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Please refer to NOAA Atlas 14 document for more information.
