APPENDICES

Saint Paul Church
Main Street
Parking Lot Expansion
Glastonbury, CT

PROJECT DESCRIPTION

The project that is the subject of this report is located on a parcel of land with an address of 2577 Main Street in Glastonbury, CT. The property has 363.44 feet of frontage on the west side of Main Street and 154.44 feet on the north side of Welles Street. It is 7.246 acres in size. Four existing buildings are located on the property which consist of a church, rectory, garage for the rectory, and residential style building used as the Knights of Columbus Hall. Several paved access drives and parking lots are located on the site. The main parking lot is west of the church in the middle portion of the site. A large cell phone tower exists on the westerly most portion of the property on a 100 x 100 foot leased area.

In recent years the congregation utilizing the Church's Main Street campus has grown due to local Church consolidation and general growth within the community, with the existing Parish Center and parking facilities no longer meet the needs of the congregation. The Applicant is therefore proposing a 2-story, 15,341 s.f. (main level: 8,355 s.f., lower level: 6,986 s.f.) building addition to the rear of the existing Church building. Approximately 1,020 s.f. of the existing structure will be demolished in order to make the building connection. The new addition will include new offices, classrooms, an assembly hall with kitchen, together with new bathroom facilities and a glass vestibule entry with elevator access to modernize and upgrade the facility. The Site is currently under parked by 39 parking spaces (192 parking spaces required per the Building-Zone Regulations, and 153 parking spaces existing on Site). The Applicant is proposing to reconfigure and expand the existing parking lot along Main Street, and towards the west with the new construction of 106 additional parking spaces, for a total of 259 on-site parking spaces (please note that a 10.1% parking waiver will be requested from the Town Plan and Zoning Commission). Other proposed site improvements include a stormwater management basin, rain garden, parking lot islands with shade trees and the installation of full-cut off 16 ft. light poles mounted to a 2 ft. concrete base.

STORMWATER MANAGEMENT DESIGN GOALS AND PRACTICES

The design goals of the stormwater management system are as follow:

General

- Design to be consistent with the Town of Glastonbury Standards for Public Improvements Section 4.0 Stormwater Management Design Standards.
- Design to be consistent with National Pollutant Discharge Elimination System (NPDES).
- Design to be consistent with the 2004 Connecticut Stormwater Quality Manual
- Design to be consistent with the 2002 Connecticut Guidelines For Soil Erosion and Sediment Control
- Design to be consistent with the Town's MS4 Permit.
- Design to be functional, environmentally sensitive & aesthetically compatible with the surrounding development.
- Incorporate Low Impact Development (LID) practices.
- Incorporate Best Management Practices (BMP's).
- Remove at least 80% of the total suspended solids & floatable pollutants before discharge to a surface water or wetland.
- Minimize loss of long term recharge during low flow periods.
- Retain 50% of the Water Quality Volume for the site in conformance with the Town of Glastonbury MS4 Permit.
- Mitigate peak runoffs to prevent any increases for storm frequency events from 2 to 100 years.

Treatment Controls

Filtering Practices

- Utilize sheet flow to parking lot islands (micro-scale control)
- Utilize stormwater management areas utilizing created wetlands & wet basins
- Utilize linear bio-swales

Infiltration/Recharge Practices

- Utilize sheet flow to parking islands (micro-scale control)
- Utilize sheet flow to road shoulders (micro-scale control)
- Utilize stormwater management areas utilizing created wetlands & wet basins
- Utilize linear bio-swales
- Utilize Stormwater Management Basin to retain 50% Water Quality Volume for the site consistent with the Town's MS4 Permit.

Settling Practices

- Design lot grading to create ponding areas in islands & shoulders (micro-scale control)
- Utilize stormwater management basins

Detention Practices for Mitigation of Peak Runoff Increase

- Design a Stormwater Management Basin (SWMB) with an Outlet Control Weir to provide detention of peak flow increases.

End of Pipe Controls

- Incorporate a Sediment Forebay
- Utilize 2' sumps in catchbasins
- Design outlet protection @ discharge points

To achieve the above enumerated goals a stormwater treatment train is incorporated into the design, including a linear raingarden to treat the runoff prior to collection in traditional catchbasins with 2' sumps. The discharge from this system is then directed to a SWMB with a wet bottom. This feature is specified to be planted with both wetland and upland plants to provide a bio-retention environment. A sediment forebay is proposed in the SWMB to isolate and contain any incoming sediments not filtered out in the linear raingarden or settled out in the catchbasin sumps.

A critical element of the stormwater management plan is the ability to capture 93% of the existing pavement and direct it into the treatment train. This provides the advantage of managing the existing runoff currently being discharged directly into the adjacent wetland system and achieve the above enumerated goals. **This is a substantial improvement in stormwater quality treatment for runoff from the site.**

METHODOLOGY

Peak rates of runoff and runoff volumes, for the purpose of determining the detention required for mitigating increases, are computed utilizing the TR-55 method according to the Town requirements. HydroCAD Stormwater Modeling software was used for these calculations.

Peak rates of surface runoffs, for the purpose of culvert sizing, are computed utilizing the Rational Method. The pipes were designed to convey flows from up to a 10 yr frequency storm event. Hydraflow Storm Sewers by inteliSOLVE was used to compute the hydraulic grade lines for the system using the runoffs computed. The Water Quality Volume is computed per the 2004 Connecticut Stormwater Quality Manual. The results are included in the appendices.

SUMMARY

- The entire proposed parking lot as well as the runoff from 93% of the existing parking lot is directed to the Treatment Train.
- The SWMB is designed to prevent any increases in peak runoffs for all storm frequency events from 2 to 100 years. The actual peak flows are as follows:

Storm Frequency Events

	2 yr	10 yr	25 yr	50 yr	100yr
Pre-Developed	5.27 cfs	13.18 cfs	18.64 cfs	23.02 cfs	27.42 cfs
Post-Developed	5.08 cfs	12.68 cfs	17.94 cfs	22.15 cfs	26.39 cfs
SWMB Outflow	4.58 cfs	12.56 cfs	16.23 cfs	18.98 cfs	21.71 cfs
Reduction	0.19 cfs	0.50 cfs	0.70 cfs	0.87 cfs	1.03 cfs

- The outlet weir of the SWMB is designed at elevation 28.6 to retain 50% of the Stormwater Quality Volume for the site as required for a Re-development site per the MS4 Permit.

[1] Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Please refer to NOAA Atlas 14 document for more information.

[1] Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Please refer to NOAA Atlas 14 document for more information.

APPENDIX G

WATER QUALITY VOLUME CALCULATIONS

Saint Paul Church
Main Street
Parking Lot Expansion
Glastonbury, CT

WQV CALCULATIONS

The WQV for the SWMB is calculated as follows:

WGV = (1")(R)(A)/12 Where: R = 0.05 + 0.009(I)
I = % Impervious Cover
A = Area in Acres

A = 11.71 AC

Impervious area = 2.87 AC

I = 2.87/11.71 = 24.5%

R = 0.05 + 0.009(24.5) = 0.271

WQV = (1")(11.71)(0.271)/12 = 0.264 ac-ft = **11,500 CF**

Existing site is > 40% impervious so qualifies under redevelopment. Therefore, system is designed to retain 50% of the WQV.

(11,500 CF)(0.5) = 5750 CF

This volume is achieved at elevation 28.6

7-1-19	-5"	-11"	-27" dry	-28" dry	-28"

The results of the standpipe readings indicate potential hydric conditions in SP-1 & SP-2. Both of these are within a sanitary sewer easement and bank of communications lines and were found to contain disturbed soils.
